

## Crew Resource Management (CRM)

The overwhelming majority of aviation accidents have been caused by human factors errors as opposed to equipment malfunction. Almost all of the human factors errors have been directly related to a breakdown in communication or a divergence from standard operating procedures. Communication and discipline in the cockpit are the marks of a professional, safe and quality crewmember.

Crew resource management is the utilization of all available resources in a logical and efficient manner. Information, equipment and people are the three fundamental sources to manage.

When I worked for Airlines interviewing potential pilots two of the things I looked for were, first multi engine time with real world experience then, did the applicant have any crew experience.

We at Multi-Engine Time Building realize that to be an effective crewmember during your aviation carrier CRM training is an essential part of your training. Combined with multi engine time, your exposure to a CRM environment will give you the confidence and edge you will need to land that airline job.
